PRESS INFORMATION

Technical fibers from EMS-GRILTECH drive innovation in the paper industry

EMS-GRILTECH is strengthening its position as a global technology leader for specialty fibers in paper machine felts (PMC), thereby supporting the efficiency and quality of modern paper production.

Paper machine felts are a key component in paper manufacturing. They stabilize the wet paper web in the press section of the machine and ensure that water is efficiently pressed out of the paper. EMS-GRILTECH supplies the high-performance fibers used to manufacture these felts.

For over 30 years, EMS has been developing innovative fiber solutions, including bicomponent fibers made of polyamide and newly developed TPU fibers made of thermoplastic polyurethane. Paper machine felts manufactured with EMS fibers are characterized by high abrasion resistance, elasticity, and dimensional stability.

The continuous development of the fibers enables more durable felts, shorter machine run-in times, and higher dryness levels in the paper. This allows paper manufacturers to save energy in the drying section and significantly reduce their production costs.

Visit the world market leader for PMC fibers at Techtextil 2026 in Frankfurt/Main from April 21-24, 2026. You will find the EMS-GRILTECH booth in hall 9.0, booth A58. We look forward to seeing you there!
